

# Report Scheduler

The Report Scheduler lets you better control your background jobs and reports to improve throughput and efficiency. If you run multiple report managers, want to prevent certain reports from running during business hours, or need to manage job dependencies and groups, Report Scheduler is what you need.

Report Scheduler helps you **manage** large numbers of stored reports

## Features Include:

- Tight integration with SX.enterprise
- Efficient use of system resources
- Wide range of report scheduling options for users and system administrators
- run multiple stored reports at the same time
- execute chains of related reports as a group
- designate dependencies so that a particular report must finish before another designated report begins
- design execution queues to be active only at certain times

- System Administrator can limit the availability of certain stored reports during critical business hours
- resource-intensive reports can be limited to special queues that will be active only at times when these reports would have minimal impact on the overall responsiveness of the system.
- The number of simultaneous report jobs allowed to run can be controlled
- hold or release report queues on command
- reschedule pending jobs
- handle report jobs that may have terminated abnormally
